Lighthouse results

PageSpeed Insights captured this audit at 8:37 PM EST on November 1, 2026, using Lighthouse 13.6.0 and HeadlessChromium 153.0.8010.36. Mobile used an emulated Moto G Power and slow 4G throttling; desktop used an emulated desktop with custom throttling. These are laboratory results, not real-user measurements.

Metric	Mobile	Desktop
Performance	86	100
Accessibility	100	100
Best practices	100	100
SEO	100	100
First contentful paint	0.8 s	0.2 s
Largest contentful paint	0.8 s	0.2 s
Total blocking time	0 ms	0 ms
Cumulative layout shift	0.273	0
Speed index	0.8 s	0.2 s

Identified issue and implemented optimization

A source review found an obsolete .project-number CSS rule after the gallery changed from numbered panels to JPG illustrations. The unused rule was removed. This reduces unnecessary stylesheet code; no before-and-after Lighthouse score improvement is claimed.

The gallery also uses optimized 720 x 420 JPGs totaling 61,141 bytes, explicit image dimensions, and lazy loading. System fonts and vanilla JavaScript avoid external font and framework downloads.

Remaining audit finding

The mobile audit reported layout shift of 0.273, compared with 0 on desktop. It also identified render-blocking requests, cache lifetime opportunities, and image delivery savings. The mobile layout-shift cause has not yet been isolated or corrected. Scores can vary between runs, and automated accessibility checks do not replace human testing.

Two-browser functional checks

The published site was checked in the ChatGPT in-app browser and Google Chrome on November 1. The in-app browser loaded the live homepage, styles, JavaScript, and all three project images. Local responsive checks at 375, 768, and 1280 pixels found no horizontal page overflow; keyboard menu controls, filtering, form errors, successful preview, reset, and theme switching were exercised.

In Chrome on the published site, the cloud filter displayed the correct single project. Empty-form validation, a valid message preview, reset, and theme switching worked. At a 375-pixel viewport, document client and scroll widths both measured 360 pixels. Enter opened the menu and Escape closed it. One automated pointer attempt on the acknowledgement checkbox did not change its state; keyboard Space checked it successfully. This remains a pointer-test limitation, not a verified failure of every pointer interaction.

Audit record
